

LogPulse AI - Incident Report

Generated : 2026-06-01 12:15:43 UTC

Trace ID : 03623b0d-5d64-4c48-9d68-08986235f27d

1 - Incident Summary

Incident ID : 03623b0d
Category : Memory
Severity : SeverityLevel.FATAL
Source : Kubernetes
Cache : MISS

2 - Raw Log

```
2026-06-01T10:15:30Z [FATAL] k8s-node-worker-247 pod/northwind-api-worker OOMKilled: Out of memory resource limit reached. Container exited with code 137
```

3 - Classification

Category : Memory
Severity : SeverityLevel.FATAL
Summary : Kubernetes worker killed due to out-of-memory limit.
Source : Kubernetes

4 - Diagnosis

Root Cause : The 'northwind-api-worker' pod exceeded its configured Kubernetes memory limit, causing the container runtime to terminate it with exit code 137 (OOMKilled).
Confidence : 95%
Reasoning : The raw log explicitly shows a fatal OOMKilled event with exit code 137 for the 'northwind-api-worker' pod, which matches the retrieved playbook for insufficient memory limits.
Source Tier : Ilm
Used History : No
Used Playbook : Yes

5 - Proposed Solution

Explanation:

Gemini unavailable; remediation derived from playbook 'Pod OOMKilled Due to Insufficient Memory Limit' (RAG confidence=0.7399). Review the playbook steps and adapt commands to the live environment before execution.

Steps:

- 1. Analyze historical application memory usage patterns using monitoring tools (e.g., Prometheus/Grafana, `kubectl top pod`). Identify the peak memory consumption.
- 2. Increase the `resources.limits.memory` for the affected container in its Deployment, StatefulSet, or Pod definition. It is often good practice to increase `resources.requests.memory` proportionally to ensure proper scheduling.
- 3. Apply the updated Kubernetes manifest to trigger a rollout and redeploy the affected pods.
- 4. Monitor the new deployment to confirm stable memory usage and absence of OOMKilled events.
- 5. name: my-app-container

Commands:

```
$ kubectl top pod
$ kubectl apply -f deployment.yaml
```

6 - Risk Assessment

Risk Level : **RISKLEVEL.SAFE**

Safe Commands (2):

- [OK] kubectl top pod
- [OK] kubectl apply -f deployment.yaml

Flagged Commands (0):

(none)

7 - Operator Decision

Operator rejected -- no execution.

8 - Historical Context

Times Seen : 1

First occurrence -- no prior incidents.

9 - Incident Timeline

```
[09:06:51] INCIDENT_RECEIVED -> Incident received (trace_id=03623b0d...)
[09:06:51] CACHE_MISS -> Cache miss -- routing to classifier
[09:07:00] INCIDENT_CLASSIFIED -> Memory / Fatal
[09:07:05] RAG_RETRIEVED -> Playbook retrieved (filtered) -- Memory conf=0.74
[09:08:55] ROOT_CAUSE_GENERATED -> The 'northwind-api-worker' pod exceeded its configured
Kubernetes memory limit, causing the container runtime to termina
[09:10:42] SOLUTION_GENERATED -> 5 step(s) from playbook
[09:10:42] RISK_ASSESSED -> safe -- 0 flagged
[09:15:42] WORKFLOW_COMPLETED -> Completed in 530490ms
```
