Generated : 2026-05-29 15:30:28 UTC

Trace ID : 48cf1011-bca0-48b3-8cee-3506031b86bd

1 - Incident Summary

Incident ID : 48cf1011
Category : Memory
Severity : SeverityLevel.CRITICAL
Source : Kubernetes
Cache : MISS

2 - Raw Log

```
pod/worker-api OOMKilled exceeded memory limit 256Mi
```

3 - Classification

Category : Memory
Severity : SeverityLevel.CRITICAL
Summary : Kubernetes worker API pod killed for exceeding its memory limit.
Source : Kubernetes

4 - Diagnosis

Root Cause : The worker-api pod is consistently OOMKilled because its configured memory limit of 256Mi is insufficient for its operational requirements, leading to repeated resource exhaustion.

Confidence : 98%

Reasoning : The raw log indicates an OOMKill at 256Mi, the retrieved playbook directly addresses 'Insufficient Memory Limit', and the incident history explicitly states the previous root cause for this exact recurring incident was an insufficient 256Mi memory limit.

Source Tier : llm
Used History : Yes
Used Playbook : Yes

5 - Proposed Solution

Explanation:

Gemini unavailable; remediation derived from playbook 'Pod OOMKilled: Insufficient Memory Limit' (RAG confidence=0.7930). Review the playbook steps and adapt commands to the live environment before execution.

Steps:

- 1. Verify the `OOMKilled` status using `kubectl get pod <pod-name> -o yaml`.
- 2. Check container memory usage metrics (e.g., Prometheus/Grafana) to identify peak memory consumption.
- 3. Analyze application logs for clues about memory spikes or growth patterns.
- 4. Increase the `resources.limits.memory` for the affected container in its Deployment/StatefulSet manifest.
- 5. Roll out the updated deployment using `kubectl apply -f <manifest-file>` or `kubectl rollout restart deployment/<deployment-name>`.
- 6. name: my-app

6 - Risk Assessment

Risk Level : RISKLEVEL.SAFE

Safe Commands (0):

(none)

Flagged Commands (0):

(none)

7 - Operator Decision

Operator rejected -- no execution.

8 - Historical Context
