Trace ID : e48417d7-4397-4328-b445-f21ed11d3057

1 - Incident Summary

Incident ID : e48417d7
Category : Memory
Severity : SeverityLevel.CRITICAL
Source : Kubernetes
Cache : MISS

2 - Raw Log

```
pod/worker-api OOMKilled exceeded memory limit 256Mi
```

3 - Classification

Category : Memory
Severity : SeverityLevel.CRITICAL
Summary : Kubernetes worker API pod killed for exceeding its memory limit.
Source : Kubernetes

4 - Diagnosis

Root Cause : The worker-api pod is consistently OOMKilled because its configured memory limit of 256Mi is insufficient for its operational requirements, leading to repeated resource exhaustion.

Confidence : 98%

Reasoning : The raw log explicitly states 'OOMKilled exceeded memory limit 256Mi'. This is directly corroborated by the classification, the highly confident playbook 'Pod OOMKilled: Insufficient Memory Limit', and the incident history showing this exact issue has occurred 16 times before with the same identified root cause.

Source Tier : llm
Used History : Yes
Used Playbook : Yes

5 - Proposed Solution

Explanation:

Gemini unavailable; remediation derived from playbook 'Pod OOMKilled: Insufficient Memory Limit' (RAG confidence=0.7930). Review the playbook steps and adapt commands to the live environment before execution.

Steps:

- 1. Verify the `OOMKilled` status using `kubectl get pod <pod-name> -o yaml`.
- 2. Check container memory usage metrics (e.g., Prometheus/Grafana) to identify peak memory consumption.
- 3. Analyze application logs for clues about memory spikes or growth patterns.
- 4. Increase the `resources.limits.memory` for the affected container in its Deployment/StatefulSet manifest.
- 5. Roll out the updated deployment using `kubectl apply -f <manifest-file>` or `kubectl rollout restart deployment/<deployment-name>`.
- 6. name: my-app

6 - Risk Assessment

Risk Level : **RISKLEVEL.SAFE**

Safe Commands (0):

(none)

Flagged Commands (0):

(none)

7 - Operator Decision

Operator rejected -- no execution.
